## PARAMETERS ACCESSIBLE THROUGH RS232

The working and monitoring parameters of the LPFRS are accessible for read and write operations through the serial RS-232 port (1200 bits/sec., no parity, 1 start bit, 8 data bits, 1 stop bit).

There are three different commands, which are:

M, Cxx and Fxx followed by a carriage return.

M: monitors the basic factory adjustments of the atomic clock.

The returned answer looks like

HH GG FF EE DD CC BB AA <CR>

Where each returned byte is an ASCII coded hexadecimal value, separated by a <Space> character. All parameters are coded at full scale.

HH: DC-Voltage of the photocell (5V to 0V)

GG: peak voltage of Rb-signal (0 to 5V)

FF: not used

EE: varactor control voltage (0 to 5V)

DD: Read-back of the user provided frequency adjustment voltage on pin 2 (0 to 5V)

CC: Rb-lamp heating current (500mA to 0mA)

BB: Rb-cell heating current (500mA to 0mA)

AA: 90MHz power control signal (0 to 5V)

Cxx: output frequency correction through the synthesizer, by steps of  $1 \times 10^{-9}$ , where xx is a signed 8 bits word. This value is automatically stored in a EEPROM.

Fxx: output frequency correction through C- field, by steps of  $1 \times 10^{-11}$ , where xx is a signed 8 bits word.
